Practical - V

Roll No. :48	Name:Kaushal Yadav
Class :SY . IT	Batch : 00
Date of Assignment :22/07/26	Date/Time of Submission ::22/07/26

- a. Create a binary search tree.

Code:

```
class TreeNode:
    def __init__(self, data):
        self.data = data
        self.left = None
        self.right = None

root = TreeNode('R')
nodeA = TreeNode('A')
nodeB = TreeNode('B')
nodeC = TreeNode('C')
nodeD = TreeNode('D')
nodeE = TreeNode('E')
nodeF = TreeNode('F')
nodeG = TreeNode('G')

root.left = nodeA
root.right = nodeB

nodeA.left = nodeC
nodeA.right = nodeD

nodeB.left = nodeE
nodeB.right = nodeF

nodeF.left = nodeG
print("root.right.left.data:", root.right.left.data)
print("Kaushal Yadav ==48")
```

```
class TreeNode:
    def __init__(self, data):
        self.data = data
        self.left = None
        self.right = None
```

```

root = TreeNode('R')
nodeA = TreeNode('A')
nodeB = TreeNode('B')
nodeC = TreeNode('C')
nodeD = TreeNode('D')
nodeE = TreeNode('E')
nodeF = TreeNode('F')
nodeG = TreeNode('G')

root.left = nodeA
root.right = nodeB

nodeA.left = nodeC
nodeA.right = nodeD

nodeB.left = nodeE
nodeB.right = nodeF

nodeF.left = nodeG
print("root.right.left.data:", root.right.left.data)
print("Kaushal Yadav ===48")

```

Output:

```

root.right.left.data: E
Kaushal Yadav ===48

```

B.Insert nodes into a binary search tree.

Code:

```

class TreeNode:
    def __init__(self, data):
        self.data = data
        self.left = None
        self.right = None

root = TreeNode('R')
nodeA = TreeNode('A')
nodeB = TreeNode('B')

```

```

nodeC = TreeNode('C')
nodeD = TreeNode('D')
nodeE = TreeNode('E')
nodeF = TreeNode('F')
nodeG = TreeNode('G')

root.left = nodeA
root.right = nodeB

nodeA.left = nodeC
nodeA.right = nodeD

nodeB.left = nodeE
nodeB.right = nodeF

nodeF.left = nodeG
#Test
print("root.right.left.data:", root.right.left.data)

def insert(root, data):
    if root is None:
        return TreeNode(data)

    if data < root.data:
        root.left = insert(root.left, data)
    elif data > root.data:
        root.right = insert(root.right, data)

    return root

new_node = input("Enter element to insert: ")
root = insert(root, new_node)

print("Node inserted successfully.")
print("Kaushal ===48")
"""

```

Output:

```
root.right.left.data: E
Enter element to insert: G
Node inserted successfully.
Kaushal   ===48
```

C.Search for a node in a binary search tree.

Code:

```
class TreeNode:
```

```
    def __init__(self, data):
```

```
        self.data = data
```

```
        self.left = None
```

```
        self.right = None
```

```
root = TreeNode('R')
```

```
nodeA = TreeNode('A')
```

```
nodeB = TreeNode('B')
```

```
nodeC = TreeNode('C')
```

```
nodeD = TreeNode('D')
```

```
nodeE = TreeNode('E')
```

```
nodeF = TreeNode('F')
```

```
nodeG = TreeNode('G')
```

```
root.left = nodeA
```

```
root.right = nodeB
```

```
nodeA.left = nodeC
```

```
nodeA.right = nodeD
```

```
nodeB.left = nodeE
```

```
nodeB.right = nodeF
```

```
nodeF.left = nodeG
```

```
#Test
```

```
print("root.right.left.data:", root.right.left.data)
```

```
def search(root, key):
```

```
if root is None:
    return False

print("Checking:", root.data)

if root.data == key:
    return True

return search(root.left, key) or search(root.right, key)
```

```
key = input("Enter element to search: ")
```

```
# Search
if search(root, key):
    print("Element Found")
else:
    print("Element Not Found")
print("Amit 44")
```

```
class TreeNode:
    def __init__(self, data):
        self.data = data
        self.left = None
        self.right = None
```

```
root = TreeNode('R')
nodeA = TreeNode('A')
nodeB = TreeNode('B')
nodeC = TreeNode('C')
nodeD = TreeNode('D')
nodeE = TreeNode('E')
nodeF = TreeNode('F')
nodeG = TreeNode('G')
```

```
root.left = nodeA
root.right = nodeB
```

```
nodeA.left = nodeC
nodeA.right = nodeD
```

```
nodeB.left = nodeE
nodeB.right = nodeF
```

```

print("root.right.left.data:", root.right.left.data)

def search(root, key):
    if root is None:
        return False

    print("Checking:", root.data)

    if root.data == key:
        return True

    return search(root.left, key) or search(root.right, key)

key = input("Enter element to search: ")

# Search
if search(root, key):
    print("Element Found")
else:
    print("Element Not Found")
print("Kaushal Yadav==48|")

```

Output:

```

root.right.left.data: E
Enter element to search: F
Checking: R
Checking: A
Checking: C
Checking: D
Checking: B
Checking: E
Checking: F
Element Found
Kaushal Yadav==48
|

```
